‘The use of Programmable Keys (PKeys) for frequently used commands will help reduce repetitive manual entries, save processing time, and minimize keying errors.’

Step 1. From the **Tools** menu, select **Programmable Keys Editor in Smartpoint flex and classic windows.**

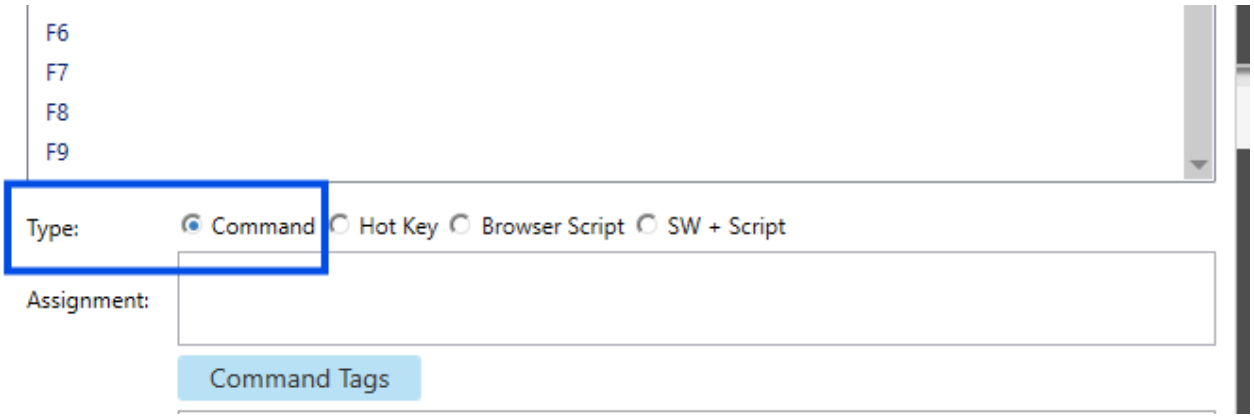

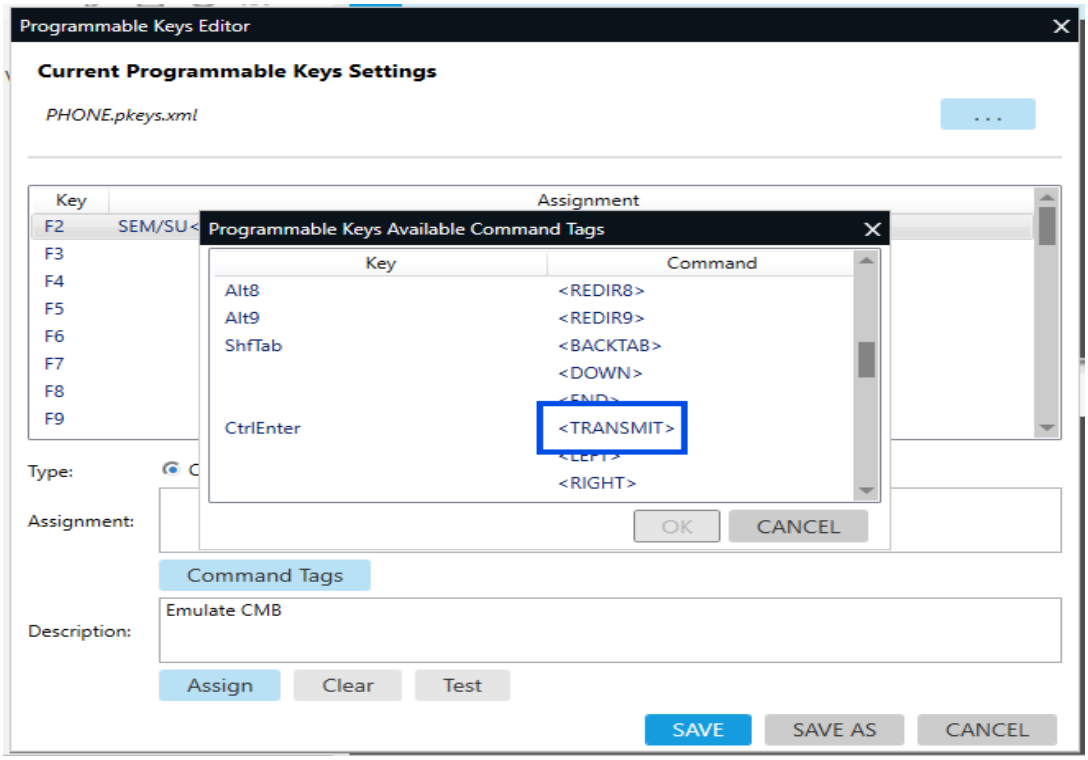

Step 2. From the **Key list** select the key you want to use. For example, **F2.**

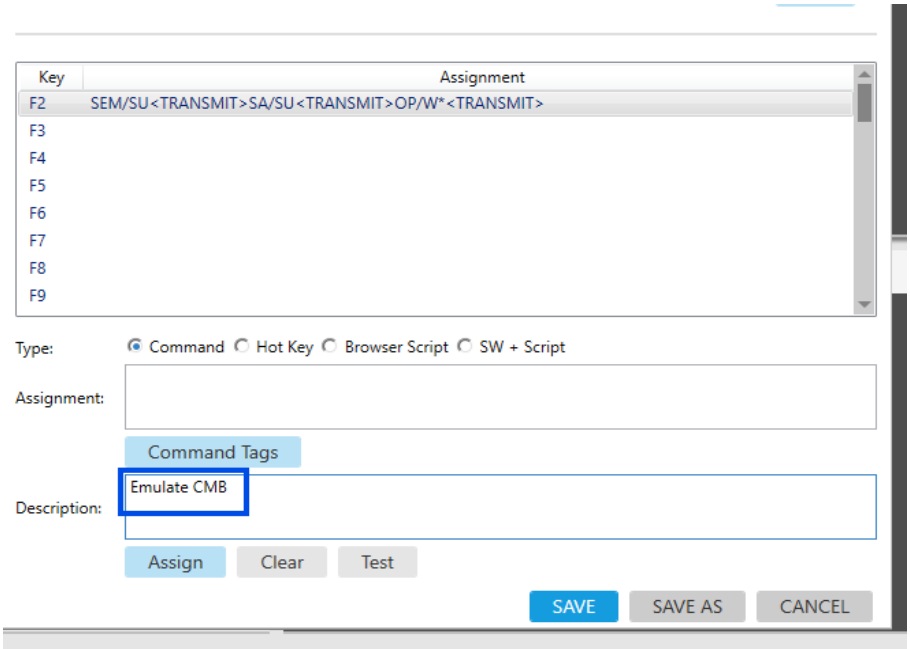

Step 3. In **Type**, select the COMMAND icon type of function for the Programmable Key.

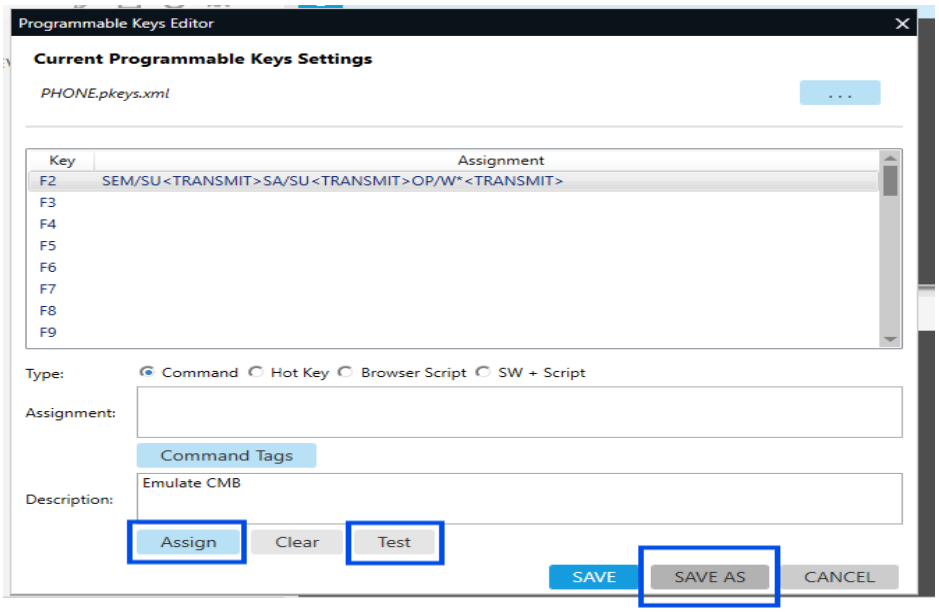

Step 4. In the **Assignment** box enter the command you wish to associate with the key. For example, to move frequently changing command; enter **SEM/SU**. Once you have finished typing the command, click back on **Command Tag** and choose from the list **<TRANSMIT>.**

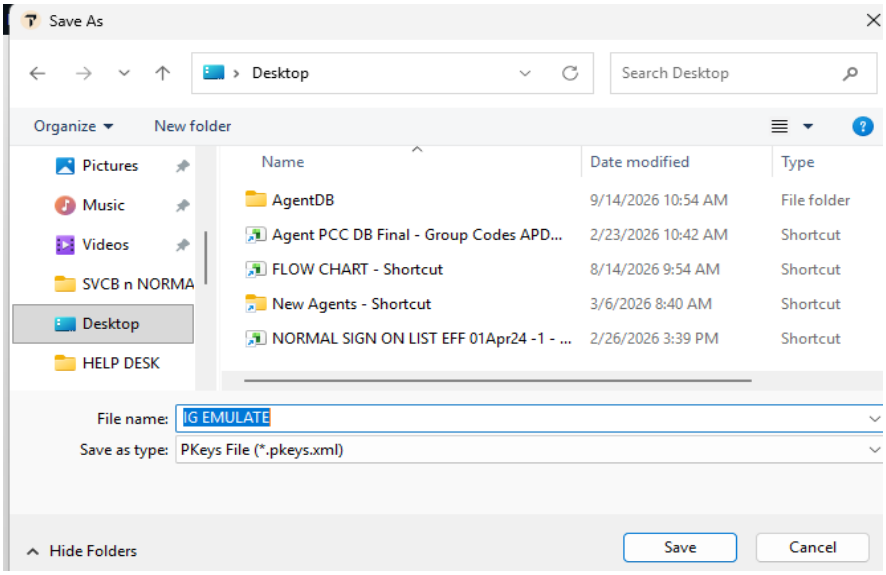

Step 5. In the **Description** box add a brief explanation of the Pkey intended usage.

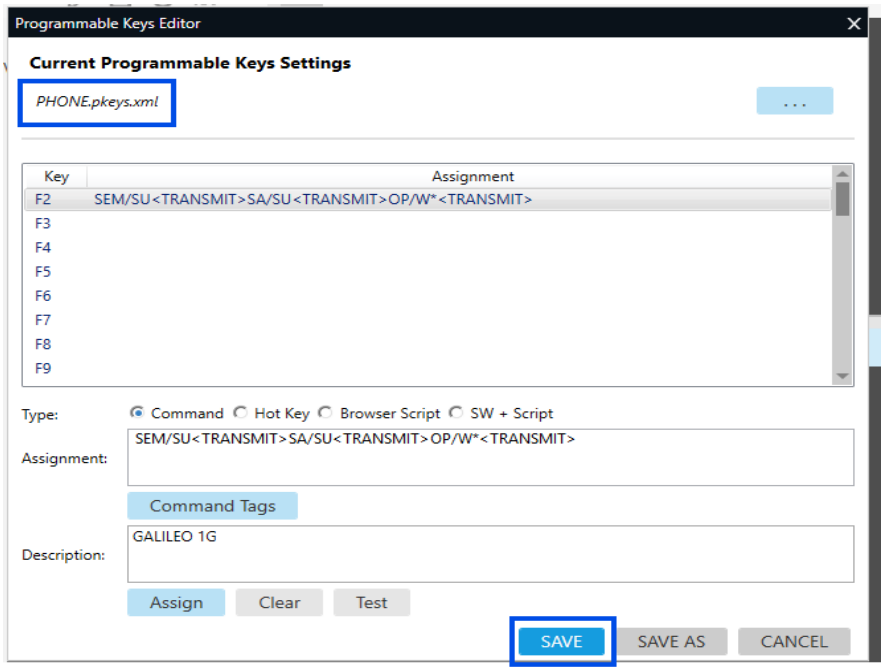

Step 6. Select '**Save As**'.

Step 7. Click on **Assign** button to associate the command with the desired key, alternatively you can **'Clear'** or select **'Test'** to trial your entry in Smartpoint to ensure accuracy before you assign it.

If required, you can add other Programmable Keys by following same steps. When adding new Pkeys only click on **SAVE**

Classic Windows Theme - you need to click on the **TOOLS** on the right side and then select Programable Keys Editor in the list. Then follow the same instructions as same as **Flew windows.**
